

The SaniCart® delivers a fine micro fog that provides complete wall to wall disinfectant coverage—ideal for hatcheries.

Rapid Deployment Technology For Semi-Autonomous Treatment

THE PROBLEM

Poultry operations face intense biosecurity pressure especially during HPAI seasons, yet whole-room treatment is often delayed or inconsistent due to labor constraints and off-shift staffing. High-risk zones like live-haul trailers, load out docks, holding rooms, hatchery corridors/egg rooms, locker rooms, and wash bays are difficult to treat thoroughly with manual spray. Additionally Crews are exposed to chemicals, increases turnarounds time, and treatment quality varies from site to site. This increases the risk of cross-site transfer and extends downtime between flocks.

THE SOLUTION

SaniCart™ provides rapid, semi-automated, room-wide application of approved disinfectants as micro fog engulfing the whole room wall-to-wall. Ideal for routine sanitizations between-flock turns, trailer sanitization between loads, and emergency deployments to reinforce poultry biosecurity.

Why SaniCart™ Technology?

A mobile, plug-in (or battery) platform that reduces manual exposure, improves turnaround consistency, and gets spaces back online faster. SaniCart is purpose-built technology for poultry facilities, barns, and logistics areas where speed and coverage matter.

Key Advantages:

- **Plug in, set cycle, press START.** Auto shut-off at end of cycle.
- **Whole room coverage:** air and hard-to-reach surfaces (ceilings, equipment undersides).
- Works with **numerous approved chemistries** (per label).
- **Lightweight, durable** frame; easy room-to-room or site-to-site mobility.
- Optional **battery models; adjustable/detachable nozzle** for precision.

Poultry-specific applications:

- Treat trailers between loads
- Loading docks and break rooms between shifts
- Hatchery corridors/egg rooms
- Staff areas without long wet-down cycles
